EMPIRE Data Assimilation Documentation

1.1 Downloading

These codes are hosted on www.bitbucket.org and can be attained with the following commands:

```
git clone https://www.bitbucket.org/pbrowne/empire-data-assimilation.git
```

Copyright

These codes are distributed under the GNU GPU v3 Licence. See LICENCE.txt.

1.2 Compiling

1.2.1 Compilation of the source code

The Makefile must be editted for the specific compiler setup. In the main directory you will find the file `Makefile`. Edit the variables as follows:

- `FC` The fortran compiler

This has been tested with gfortran 4.8.2

- `FCOPTS` The options for the fortran compiler
- `LIB_LIST` The libraries to be called. Note this must include BLAS

To compile the source code, simply then type the command

```
make
```

If successful, the following executables are created in the bin/ folder:

- empire
- alltests
- test_h
- test_hqhtr
- test_q
- test_r

To remove the object and executable files if compilation fails for some reason, run the following:

```
make clean
```

1.2.2 Compilation of the documentation

Documentation of the code is automatically generated using Doxygen, dot and pdflatex.

All of these packages must be installed for the following to work.

```
make docs
```

This will make an html webpage for the code, the mainpage for which is located in doc/html/index.html.

A latex version of the documentation will be built to the file doc/latex/refman.pdf.

To simply make the html version of the documentation (if pdflatex is not available) then use the command

```
make doc_html
```

1.3 Customising for specific models

This is where the science and all the effort should happen!!

The file model_specific.f90 should be editted for the specific model which you wish to use. This contains a number of subroutines which need to be adapted for the model and the observation network. We list these subsequently.

- configure_model This is called early in the code and can be used to read in any data from files before subsequently using them in the below operations.
- h This is the observation operator
- ht This is the transpose of the observation operator
- r This is the observation error covariance matrix R
- rhalf This is the square root of the observation error covariance matrix $R^{\frac{1}{2}}$
- solve_r This is a linear solve with the observation error covariance matrix, i.e. given b, find x such that $Rx = b$ or indeed, $x = R^{-1}b$
- solve_rhalf This is a linear solve with the square root of the observation error covariance matrix, i.e. given b, find x such that $R^{\frac{1}{2}}x = b$ or indeed, $x = R^{-\frac{1}{2}}b$
- q This is the model error covariance matrix Q
- qhalf This is the square root model error covariance matrix $Q^{\frac{1}{2}}$
- solve_hqht_plus_r This is a linear solve with the matrix $(HQH^T + R)$

Not all of these subroutines will be required for each filtering method you wish to use, so it may be advantageous to only implement the necessary ones.

1.4 Testing

You can test your user supplied routines by running the test codes found in the folder bin/.

These are by no means full-proof ways of ensuring that you have implemented things correctly, but should at least check what you have done for logical consistency.

For example, they will test if $HH^T x = x$, and if $Q^{\frac{1}{2}} Q^{\frac{1}{2}} x = Qx$ for various different vectors x.

1.5 Linking to your model using EMPIRE

Full instructions on how to put the EMPIRE MPI commands into a new model can be found at www.met.reading.ac.uk/~darc/empire.

1.6 Running

For example, to run **N_MDL** copies of the model with **N_DA** copies of empire, then the following are possible:

```
mpirun -np N_MDL model_executable : -np N_DA empire
```

```
aprun -n N_MDL -N N_MDL model_executable : -n N_DA -N N_DA empire
```

The empire executable is controlled by the namelist data file pf_parameters.dat. As such, this file should be put in the directory where empire is executed.

1.7 Bug Reports and Functionality Requests

While the code is not too large, you may email me the issue or request here.

However there is a webpage set up for this:

https://bitbucket.org/pbrowne/empire-data-assimilation/issues

subroutine to read the namelist file and save it to pf datatype Here we read pf_parameters.dat

pf_parameters.dat is a fortran namelist file. As such, within it there must be a line beginning

&pf_params

To make it (probably) work, ensure there is a forward slash on the penultimate line and a blank line to end the file

This is just the fortran standard for namelists though.

On to the content...in any order, the pf_parameters.dat may contain the following things:

Integers:

- time_obs
- time_bwn_obs

Reals, double precision:

- nudgefac
- nfac
- ufac
- Qscale
